

Our Solution

AMAGE Systems provides a set of solutions dedicated to the Construction Industry that take into account the specific requirements of construction site management staff. Our system modules enable the execution of all works from the moment of plan creation and quotation enquiries, through order execution and deliveries, to final assembly of devices, prefabricated elements and construction materials. The solution provides full monitoring of the work in progress and support in organising information flow, while reducing or even eliminating any paper documentation. AMAGE Systems is on-trend departing from the commonly used spreadsheet to the innovative „lightweight” tools that are being implemented in such models as **SaaS** and **On Premises**. Our software is also customisable, and the version for mobile devices allows real-time recording of events in the field, and also in offline mode.

Construction Supervision

Supervision functions in the AMAGE application allow for ongoing control of all resources on the construction site. By involving area coordinators, subcontractors and suppliers, it is possible to provide real and reliable information to facilitate billing, reporting and coordination of works.

- Supervision of assembly work
- Full control and verification of completed work with confirmation of correct execution
- Performance and efficiency of crews and teams with monitoring of work progress
- Integration with construction offices, and intelligent updating of assembly lists
- Dedicated modules for cabling and piping works

IT Systems for the Construction Sites

Assets under control

Who is our solution intended for?

- We expedite the work of management responsible for the compilation of information from specific selected areas and / or the entire project, providing access to all main indicators and parameters.
- We support coordinators responsible for the workflow or management of a given area, or accountable for data collection from this area, e.g. formwork lease coordinators.
- We facilitate line workers with easy access to information and quick reporting of necessary data e.g. those responsible for health and safety during construction works.

Orders and Deliveries

Functions enable the delivery workflow to be monitored and managed electronically. The flow of orders and deliveries involves subcontractors and site workers, and our software allows oversight and correction even at this level.

- Order and delivery oversight and control
- Plans and orders, comparison of plans vs. execution
- Supplier integrations including deliveries
- Dedicated supplier portals and ERP systems integration
- Complaints handling and returns
- Warehousing and stock control

Leases

The system allows tracking of the circulation of leased items in a consistent manner, effective cost control, and supports all operations relating to monthly transactions and final settlements. Additionally, the use of leased elements (e.g. formwork) can be monitored and their use optimised, alongside accelerating communication between supplier, ordering party and subcontractor.

- Lease rates and settlements
- Deliveries and returns
- Transfer between sites
- Invoicing, reminders and reports
- Warehouse (stock) / lease value over time
- Coordination and administration of subcontractors and workload

Security and Access Control

The system ensures full control of authorisation settings and provides both reliable organisational data (deadlines, reminders), and accurate data from the construction site, facilitating the work of those responsible for this area.

- Automation of reminders and schedules
- Verification of permissions on the building site
- Management of personal entitlements

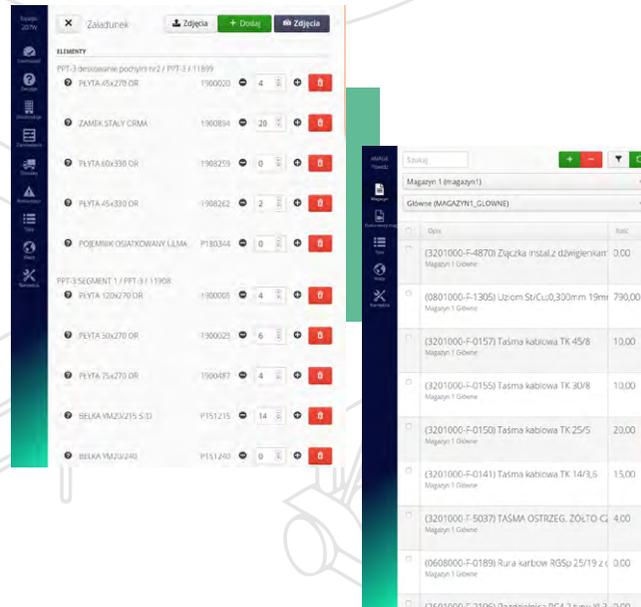

Small Equipment Rental

One central point of control for suppliers and users simplifies the daily work of the coordinator, allowing workers' involvement in the responsibility for their equipment, enabling secure transfers of equipment, as well as invoice settlement of suppliers and employees / subcontractors. This permits the creation of a coherent information database about equipment, prices and users, facilitating optimal decision-making for coordinators of this area.

- Catalogues and price lists
- Accounting for employees, subcontractors and suppliers
- Equipment hire workflow

Which construction areas does AMAGE Systems support?

- Purchase orders / supplies and stock management
- Rental / lease accounting, e.g. formwork
- Small equipment hire accounting
- Installation supervision and site handover control
- Inspection and periodic works

Contact us

to arrange a presentation of the system on site, at the client's premises, or to make a demo version available within your company.
